

Action Stories — Project Summary

A plain-language status update on the automated workflow-screen system

ENGINEERING UPDATE

WHAT THIS PROJECT IS

"Action Stories" is a template system that turns raw business data (prices, inventory, supplier terms, etc.) into ready-to-use decision screens automatically — **Reason** → **Analyze** → **Decide** → **Execute** — for every workflow a merchandising or operations team runs. Nobody hand-builds a screen per workflow. The system looks at the data itself, decides what kind of visual makes sense, and lays the page out on its own — the same way a mail-merge fills in a letter template, except here it's choosing the *shape* of the content too, not just the words.

26

Business workflows covered

105

Auto-generated screens

1,718

Content pieces placed automatically

12

Reusable components, that's all

HOW IT WORKS, IN FOUR STEPS

1. Raw Data

Numbers, prices, tables from the business

2. Auto-Sort

System decides: table? chart? card?

3. Auto-Layout

Fits pieces into a clean page, no gaps

4. Live Screen

A ready decision screen for the user

EVERYTHING IS BUILT FROM A SMALL, REUSABLE KIT

Instead of a designer drawing 105 different screens by hand, there is **one small library of 12 reusable "building blocks"** — a Table, a Chart, a Card List, a Simple Number, and so on. Every single one of the 105 screens is just a different combination of the same 12 pieces, the same way a handful of Lego bricks builds very different models. Below is how often each piece actually gets reused across the real app today — this is not a plan, it's what's already running.

Text (a headline, a note, a label)

911 uses

Label / Value List (a compact "name: value" list)

298 uses

Table (real rows & columns of data)

172 uses

Item Cards (a list of options, SKUs, or steps)

103 uses

Bar Chart (comparing amounts)

98 uses

■ Number of times this one component is reused across the 26 workflows

• THE COMPONENT LIBRARY AT A GLANCE

Every one of the 12 pieces below is a single, well-tested building block that has **no idea which workflow it's being used in** — it only knows how to display whatever data it's handed. That's what makes it reusable: the same "Table" component draws a supplier list, a price ladder, and a guardrail checklist equally well, with zero custom code written per workflow.

 Text 911 A single line — a headline, a note, a label.	 Label/Value List 298 A compact "name: value" row list — a mini fact sheet.	 Table 172 Real rows & columns — for genuinely tabular data.
 Item Cards 103 A list of richer cards — options, SKUs, steps, feed items.	 Bar Chart 98 Comparing amounts side by side.	 Yes/No Flag 54 A simple true/false indicator.
 Line Chart 33 A trend over time or steps.	 Detail Card 25 One small, self-contained descriptor.	 Number 15 A single standalone statistic.
 Scatter Chart 7 Comparing two measures across many items.	 Waterfall Chart 1 A step-by-step build-up or bridge.	 Heatmap Grid 1 A color-coded matrix at a glance.

• WHAT "DYNAMIC" ACTUALLY MEANS HERE

Three things happen automatically, with nobody deciding them screen-by-screen:

- **Auto-Sort:** the system looks at the shape of the data — is it one number? A list of options? Rows that share the same columns? — and picks the right component for it on its own.
- **Auto-Size:** a short list of 3 simple items gets a small, compact card; a long list of 20 detailed rows becomes a full table — the same underlying data type renders differently depending on how much there actually is to show.
- **Auto-Layout:** related small pieces are placed side by side to fill the page efficiently, instead of stacking everything in one long column regardless of how little space each piece needs.

In plain terms: if the business adds a brand-new workflow tomorrow with data no one has seen before, the system does not need a new screen designed for it. It reuses the same 12 building blocks and figures out the right layout by itself — that is the entire point of building it this way.

• RECENT WORK: SCREENS GOT CLEANER & SHORTER

The last round of work fixed screens that looked like a stack of plain tables and cards with wasted space. Related pieces of information now sit side-by-side instead of one-per-row, and the page gained real visual hierarchy instead of plain white everywhere. Below: how much shorter three representative screens became — same information, less scrolling.

• QUALITY CHECK — IS IT SOLID?

Every automated safety check currently passes clean

Tests passing

Screens validated

Build succeeds

Code style clean

• WHAT'S NOT READY YET — HONESTLY

The visual/data system itself is solid. What's still missing sits at the "connect it to the real company systems" layer:

- **Not yet connected to a real backend.** It currently runs on realistic sample data, not live company data. The connection point is built and ready — it just hasn't been switched on.
- **No login / security layer yet.** Anyone with the link can currently open any screen.
- **Only one action button works end-to-end** (Approve/Confirm). Other buttons shown on screens are for illustration only, not yet wired up.
- **The search bar is not functional yet** — it's on the page, but doesn't search anything yet.

• RECOMMENDED NEXT STEPS

- 1 Connect the system to a real data source and confirm the same 12 components handle real records correctly.
- 2 Add basic login/security so only the right people can see and approve each screen.
- 3 Wire up the remaining action buttons (beyond Approve/Confirm) to real business operations.
